

6.1.1.1 Re-Using Elements from One Study in Another Study

You cannot replicate an existing Study and just customize the items for the new Study. However, there are some ways to leverage what you've already done for other Studies when you create a new Study.

- You can use CRFs in multiple Studies. You can utilize CRFs for an existing Study as is, or make new versions with customizations for the new Study.
- You can assign existing users to multiple Studies. The user's Role in the new Study can be different than in existing Studies.
- You can use Rules in multiple Studies.
- You can refer to the Study Metadata from a Study to help ensure you are creating all the elements you want from it in the new Study.
