

## 12.2 Bulleted List

OpenClinica offers a number of options for displaying information in a CRF. For example, the Left Item Text, Right Item Text, and Header for any Item can contain up to 2000 characters. Additionally, the Instructions for a Section can contain up to 2000 characters. That is a lot of text to display! In some cases, it is useful to use a bulleted list.

Not valid unless obtained from the OpenClinica document management system on the day of use.

### 12.2.1 Creating a Bulleted List

A bulleted list is created using the HTML `<ul>` tag. Each element in the list is separated using the `<li>` tag. For example, the following code

```
<ul>List Title<li>Item1</li><li>Item2</li></ul>
```

will create the following...

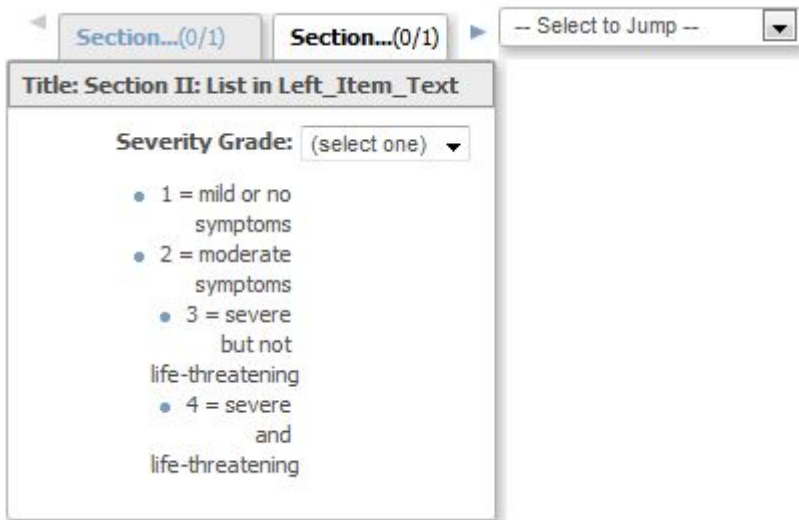

List Title

- Item1
- Item2

A bulleted list can be inserted into the Left Item Text, Right Item Text, Header, or Instructions. Theoretically, a bulleted list could exist in the Subheader, but the Subheader can only contain up to 240 characters, resulting in a very short list.

#### 12.2.1.1 Additional Tips

Adding a bulleted list to the Left Item Text may result in spacing issues, as shown below.

JQuery can be used to avoid a spacing issue. The following JQuery, when added to the Instructions column of the Section, will increase the width of the Left Item Text and set the text to left-alignment:

```
<style type="text/css">.aka_text_block{width:200px;text-align:left;}</style>
```

After making this change, the list is much easier to read:
