15.2.1 Creating a Bulleted List

A bulleted list is created using the HTML <ul> tag. Each element in the list is separated using the <li> tag. For example, the following code

**
List Title
Item1
Item2
**

will create the following...

List Title

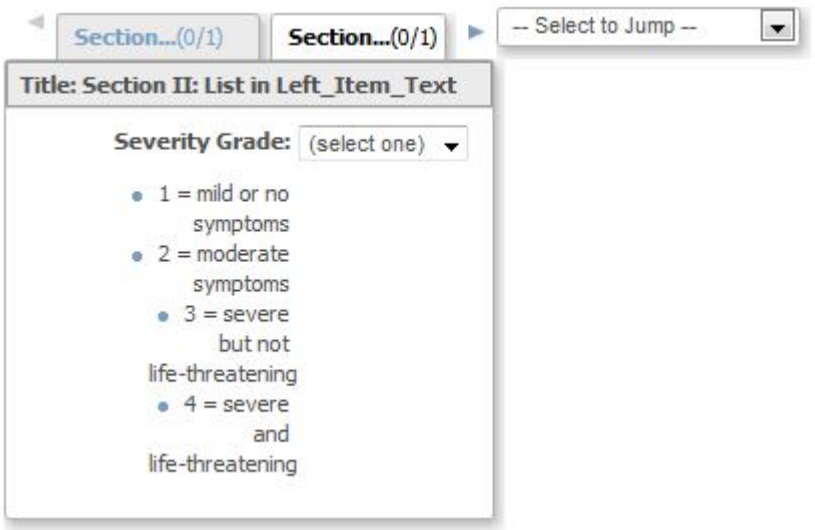

- Item1
- Item2

A bulleted list can be inserted into the Left Item Text, Right Item Text, Header, or Instructions. Theoretically, a bulleted list could exist in the Subheader, but the Subheader can only contain up to 240 characters, resulting in a very short list.

This page is not approved for publication.

15.2.1.1 Additional Tips

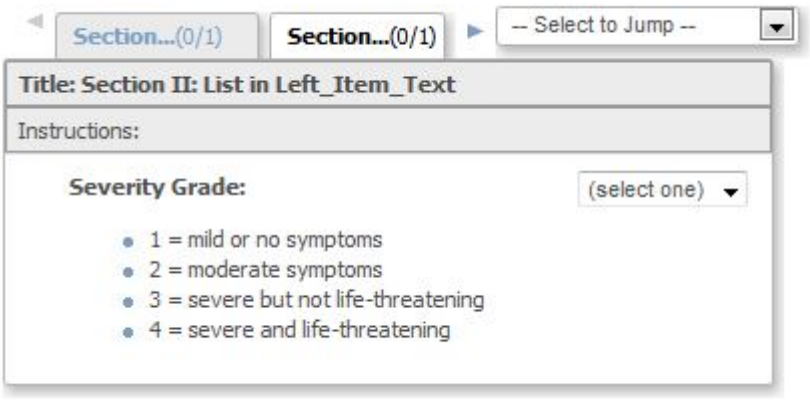

Adding a bulleted list to the Left Item Text may result in spacing issues, as shown below.

JQuery can be used to avoid a spacing issue. The following JQuery, when added to the Instructions column of the Section, will increase the width of the Left Item Text and set the text to left-alignment:

<style type="text/css">.aka_text_block{width:200px;text-align:left;}</style>

After making this chance, the list is much easier to read:
